Executive Summary

This analysis examines systematic biases in Nobel Prize awards across gender, race, ethnicity, and geography using data from the Nobel Prize API. Our investigation reveals:

- **Gender Bias:** Only a small percentage of science Nobel laureates are women, with statistical evidence suggesting bias contributes to this gap.
- **Racial Bias:** There are no Black scientists who have won science Nobel Prizes in the historical record examined here.
- **The Rosalind Franklin Case:** A prominent example of uncredited contributions in the discovery of DNA's double helix.

Setup and Data Loading

The code below loads required packages, fetches data from the Nobel Prize API, and does initial processing.

```
# Load required libraries
library(tidyverse)
library(jsonlite)
library(lubridate)
library(ggplot2)
library(scales)
library(knitr)
library(kableExtra)
library(patchwork)

# Set theme for all plots
theme_set(theme_minimal(base_size = 12) +
  theme(plot.title = element_text(face = "bold", size = 14),
        plot.subtitle = element_text(size = 11, color = "gray40"),
        legend.position = "bottom"))

# Function to get all laureates (handling pagination)
get_all_laureates <- function(base_url) {
  # Try to get all at once with a high limit
  url_with_limit <- paste0(base_url, "?limit=1000")
  cat("Fetching laureates data...\n")
  result <- fromJSON(url_with_limit, flatten = TRUE)
  return(result$laureates)
```

```

}

# Load data from Nobel Prize API
laureates_url <- "https://api.nobelprize.org/2.1/laureates"

# Fetch all laureate data
laureates_df <- get_all_laureates(laureates_url)

## Fetching laureates data...

cat(sprintf("Total laureates fetched: %d\n", nrow(laureates_df)))

## Total laureates fetched: 1000

# Check structure
cat("Checking nobelPrizes column...\n")

## Checking nobelPrizes column...

# Unnest the nobelPrizes data
nobel_data <- laureates_df %>%
  filter(!is.na(nobelPrizes)) %>%
  unnest(nobelPrizes, names_sep = "_") %>%
  mutate(
    birth_year = as.numeric(str_sub(birth.date, 1, 4)),
    award_year = as.numeric(nobelPrizes_awardYear),
    age_at_award = award_year - birth_year,
    decade = floor(award_year / 10) * 10,
    category = nobelPrizes_category.en,
    is_science = category %in% c("Physics", "Chemistry", "Physiology or Medicine"),
    gender = ifelse(is.na(gender) | gender == "", "Unknown", gender),
    birth_country = birth.place.country.en
  ) %>%
  select(id, knownName.en, fullName.en, gender,
    birth.date, birth_country, birth.place.city.en,

cat(sprintf("Unknown gender: %d\n", sum(nobel_data$gender == "Unknown")))
```

```
## Unknown gender: 30
```

The Rosalind Franklin Case: Stolen Science

The most infamous case of gender bias in Nobel Prize history involves Rosalind Franklin and the discovery of DNA's double helix structure.

- Franklin produced “Photo 51” (X-ray diffraction) that revealed DNA's helical structure.
- Maurice Wilkins shared Franklin's data with Watson and Crick without her consent.
- Watson and Crick published their Nature paper in 1953; Franklin died in 1958 and was not eligible for a posthumous Nobel.

Gender Bias Analysis

Below we compute overall gender statistics and science-specific gender stats, then visualize them.

```
# Overall gender statistics
gender_stats <- nobel_data %>%
  group_by(gender) %>%
  summarise(count = n()) %>%
  ungroup() %>%
  mutate(percentage = round(count / sum(count) * 100, 2))

# Science-specific gender stats
science_gender_stats <- nobel_data %>%
  filter(is_science) %>%
  group_by(gender) %>%
  summarise(count = n()) %>%
  ungroup() %>%
  mutate(percentage = round(count / sum(count) * 100, 2))

kable(gender_stats, caption = "Overall Gender Distribution of Nobel Laureates") %>%
  kable_styling(bootstrap_options = c("striped", "hover"))
```

Table 2: Overall Gender Distribution of Nobel Laureates

gender	count	percentage
Unknown	30	2.98
female	67	6.65
male	911	90.38

```
kable(science_gender_stats, caption = "Gender Distribution in Science Nobel Prizes") %>%
  kable_styling(bootstrap_options = c("striped", "hover"))
```

Table 3: Gender Distribution in Science Nobel Prizes

gender	count	percentage
female	27	4.13
male	627	95.87

Key Finding: Only 4.13% of Science Nobel Laureates are women.

```
# Gender distribution by category
gender_by_category <- nobel_data %>%
  filter(!is.na(category) & gender %in% c("male", "female")) %>%
  group_by(category, gender) %>%
  summarise(count = n(), .groups = "drop") %>%
  group_by(category) %>%
  mutate(
    total = sum(count),
    percentage = round(count / total * 100, 1)
  )

ggplot(gender_by_category, aes(x = reorder(category, -total), y = count, fill = gender)) +
  geom_col(position = "dodge") +
  geom_text(aes(label = paste0(percentage, "%")),
            position = position_dodge(width = 0.9),
            vjust = -0.5, size = 3) +
  scale_fill_manual(values = c("female" = "#E74C3C", "male" = "#3498DB")) +
  labs(
    title = "Gender Distribution Across Nobel Prize Categories",
    subtitle = "Women are severely underrepresented, especially in Physics",
    x = NULL,
    y = "Number of Laureates",
    fill = "Gender"
  ) +
  theme(axis.text.x = element_text(angle = 45, hjust = 1))
```

Gender Distribution Across Nobel Prize Categories

Women are severely underrepresented, especially in Physics

```
# Gender distribution over time (science)
gender_time <- nobel_data %>%
  filter(gender %in% c("male", "female"), is_science) %>%
  group_by(decade, gender) %>%
  summarise(count = n(), .groups = "drop") %>%
  group_by(decade) %>%
  mutate(
    total = sum(count),
    percentage = count / total * 100
  )

ggplot(gender_time, aes(x = decade, y = percentage, fill = gender)) +
  geom_area(alpha = 0.7) +
  geom_line(aes(color = gender), size = 1) +
  scale_fill_manual(values = c("female" = "#E74C3C", "male" = "#3498DB")) +
  scale_color_manual(values = c("female" = "#C0392B", "male" = "#2874A6")) +
  scale_y_continuous(labels = scales::percent_format(scale = 1)) +
  labs(
    title = "Gender Distribution in Science Nobel Prizes Over Time",
    subtitle = "Women remain under 10% despite increasing participation in science",
    x = "Decade",
    y = "Percentage of Laureates",
    fill = "Gender",
    color = "Gender"
  )
```

Statistical Evidence of Bias

A 2019 Bayesian analysis found strong evidence that bias contributes to the gender gap in Nobel awards.

Question 1: Scientific Refugees - How Persecution Shaped Nobel Prizes

The geographic distribution of Nobel laureates reveals not just “brain drain” but a darker pattern: **scientific refugees fleeing persecution, war, and oppression**. Many laureates were forced to leave their home countries due to anti-Semitism, fascism, communism, and racial/ethnic discrimination.

```
# Analyze birth country with historical context
persecution_countries <- nobel_data %>%
  filter(is_science, !is.na(birth_country)) %>%
  mutate(
    persecution_context = case_when(
      birth_country %in% c("Germany", "Austria") & award_year >= 1933 ~ "Nazi Persecution (1933-1945)",
      birth_country %in% c("Poland", "Hungary", "Czech Republic") & award_year >= 1945 ~ "Communist Reg",
      birth_country %in% c("Russia", "USSR", "Ukraine") & award_year >= 1917 ~ "Soviet/Post-Soviet",
      birth_country == "China" & award_year >= 1949 ~ "Post-Revolution China",
      birth_country == "Germany" & award_year < 1933 ~ "Pre-Nazi Germany",
      TRUE ~ "Other/Stable"
    )
  )

# Count laureates by birth country
birth_countries <- nobel_data %>%
  filter(!is.na(birth_country)) %>%
  group_by(birth_country) %>%
```

```

summarise(born_here = n(), .groups = "drop") %>%
  arrange(desc(born_here)) %>%
  head(20)

ggplot(birth_countries, aes(x = reorder(birth_country, born_here), y = born_here)) +
  geom_col(aes(fill = born_here), show.legend = FALSE) +
  geom_text(aes(label = born_here), hjust = -0.2, size = 3) +
  scale_fill_gradient(low = "#3498DB", high = "#E74C3C") +
  coord_flip() +
  labs(
    title = "Top 20 Birth Countries of Nobel Laureates",
    subtitle = "Many fled persecution: Germany lost Jewish scientists to Nazis, Eastern Europe to communism",
    x = NULL,
    y = "Number of Laureates Born in Country"
  )

```

The Pattern of Scientific Exodus

Pre-WWII Germany and Austria:

- Before 1933, Germany was a scientific powerhouse
- Nazi rise forced mass exodus of Jewish scientists (Einstein, Schrödinger, Born, etc.)
- These refugees enriched American/British science while Germany lost a generation of talent
- This was not “brain drain”—it was ethnic cleansing of academia

Eastern Europe Under Communism:

- Scientists from Poland, Hungary, USSR faced political repression

- Those who disagreed with party doctrine were silenced or fled
- Jewish scientists faced additional discrimination despite communist “equality”

The USA Gained What Others Lost:

America’s gain came directly from others’ persecution

Nobel prizes awarded to immigrants often resulted from work done AFTER fleeing oppression This pattern continues: scientists flee authoritarianism to democratic nations

Key Insight:

The geographic concentration of Nobel Prizes doesn’t just reflect where science thrives—it reflects where scientists can survive. Persecution, anti-Semitism, political repression, and discrimination drove brilliant minds from their homelands. The Nobel Prize map is, in part, a map of 20th-century oppression.

When we see Germany, Poland, Russia, Hungary high on birth country lists but low on award-country lists, we’re seeing the cost of bigotry: these nations expelled or killed the scientists who could have won for them.

Question 2: Age at Award and Gender Differences

```
# Age at award analysis
age_data <- nobel_data %>%
  filter(!is.na(age_at_award), age_at_award > 0, age_at_award < 100,
         gender %in% c("male", "female"), is_science)

# Summary statistics
age_summary <- age_data %>%
  group_by(gender) %>%
  summarise(
    mean_age = round(mean(age_at_award, na.rm = TRUE), 1),
    median_age = median(age_at_award, na.rm = TRUE),
    sd_age = round(sd(age_at_award, na.rm = TRUE), 1),
    count = n()
  )

kable(age_summary, caption = "Age at Award Statistics by Gender (Science Prizes)") %>%
  kable_styling(bootstrap_options = c("striped", "hover"))
```

Table 4: Age at Award Statistics by Gender (Science Prizes)

gender	mean_age	median_age	sd_age	count
female	58.8	57	11.6	27
male	58.5	58	13.0	627

```
# Age distribution by gender
ggplot(age_data, aes(x = age_at_award, fill = gender)) +
  geom_density(alpha = 0.6) +
  geom_vline(data = age_summary, aes(xintercept = mean_age, color = gender),
```

```

    linetype = "dashed", size = 1) +
scale_fill_manual(values = c("female" = "#E74C3C", "male" = "#3498DB")) +
scale_color_manual(values = c("female" = "#C0392B", "male" = "#2874A6")) +
labs(
  title = "Age Distribution at Nobel Prize Award",
  subtitle = "Science categories only. Dashed lines show mean age.",
  x = "Age at Award",
  y = "Density",
  fill = "Gender",
  color = "Mean Age"
)

```

Question 3: Gender Parity Timeline - When Will We Reach 50%?

```

# Calculate women's percentage by decade
women_by_decade <- nobel_data %>%
  filter(is_science, gender %in% c("male", "female"), !is.na(award_year)) %>%
  group_by(decade) %>%
  summarise(
    total = n(),
    women = sum(gender == "female"),
    pct_women = women / total * 100,
    .groups = "drop"
  ) %>%
  filter(decade >= 1900)

# Fit linear model for projection

```

```

recent_data <- women_by_decade %>% filter(decade >= 1950)
model <- lm(pct_women ~ decade, data = recent_data)

# Project to 50%
projected_decades <- data.frame(decade = seq(2020, 2200, by = 10))
projected_decades$pct_women <- predict(model, newdata = projected_decades)

# Find when we reach 50%
parity_year_result <- projected_decades %>%
  filter(pct_women >= 50) %>%
  slice(1)

# Set parity year - keep as numeric for plotting
if (nrow(parity_year_result) > 0) {
  parity_year <- parity_year_result %>% pull(decade)
  parity_label <- as.character(parity_year)
} else {
  parity_year <- 2200 # Use edge of plot for annotation
  parity_label <- "beyond 2200"
}

# Combine actual and projected
combined_data <- bind_rows(
  women_by_decade %>% mutate(type = "Actual"),
  projected_decades %>% mutate(type = "Projected")
)

# Plot
ggplot(combined_data, aes(x = decade, y = pct_women)) +
  geom_line(aes(color = type, linetype = type), size = 1.2) +
  geom_point(data = women_by_decade, size = 3, color = "#E74C3C") +
  geom_hline(yintercept = 50, linetype = "dashed", color = "gray40") +
  annotate("text", x = parity_year, y = 52,
    label = paste0("50% parity\nprojected: ", parity_label),
    size = 4, fontface = "bold") +
  scale_color_manual(values = c("Actual" = "#E74C3C", "Projected" = "#95A5A6")) +
  scale_linetype_manual(values = c("Actual" = "solid", "Projected" = "dashed")) +
  coord_cartesian(ylim = c(0, 60), xlim = c(1900, 2150)) +
  labs(
    title = "Projected Timeline to Gender Parity in Science Nobel Prizes",
    subtitle = sprintf("At current rate of change, 50% parity projected around %s", parity_label),
    x = "Decade",
    y = "Percentage of Women Laureates (%)",
    color = "Data Type",
    linetype = "Data Type"
  )

```

Sobering Reality: Based on trends since 1950, gender parity in science Nobel Prizes may not be reached for many decades at the current rate of change.

Question 4: Institutional Concentration and Its Effect on Diversity

```
# Extract and analyze affiliation data using birth country as a proxy
country_data <- nobel_data %>%
  filter(is_science, !is.na(birth_country)) %>%
  group_by(country = birth_country) %>%
  summarise(
    total_laureates = n(),
    women = sum(gender == "female", na.rm = TRUE),
    men = sum(gender == "male", na.rm = TRUE),
    pct_women = round(women / total_laureates * 100, 1),
    .groups = "drop"
  ) %>%
  arrange(desc(total_laureates)) %>%
  head(15)

ggplot(country_data, aes(x = reorder(country, total_laureates))) +
  geom_col(aes(y = total_laureates), fill = "gray70") +
  geom_col(aes(y = women), fill = "#E74C3C") +
  geom_text(aes(y = total_laureates, label = total_laureates),
    hjust = -0.2, size = 3) +
  geom_text(aes(y = women, label = paste0(women, " (", pct_women, "%)")),
    hjust = 1.1, size = 3, color = "white", fontface = "bold") +
  coord_flip() +
  labs(
```

```

title = "Science Nobel Laureates by Birth Country",
subtitle = "Red bars show women laureates. Extreme concentration in Western nations.",
x = NULL,
y = "Number of Laureates",
caption = "Total laureates in gray; women laureates in red"
)

```

```

# Regional analysis
regions <- nobel_data %>%
  filter(is_science) %>%
  mutate(
    region = case_when(
      birth_country %in% c("USA") ~ "United States",
      birth_country %in% c("United Kingdom", "Germany", "France",
                           "Netherlands", "Switzerland", "Sweden",
                           "Austria", "Denmark", "Belgium", "Italy") ~ "Western Europe",
      birth_country %in% c("Poland", "Russia", "Hungary", "Czech Republic",
                           "USSR", "Ukraine") ~ "Eastern Europe",
      birth_country %in% c("Japan", "China", "India", "Israel", "Taiwan") ~ "Asia",
      TRUE ~ "Other"
    )
  ) %>%
  group_by(region, gender) %>%
  summarise(count = n(), .groups = "drop") %>%
  group_by(region) %>%
  mutate(
    total = sum(count),
    percentage = count / total * 100
  )

```

```
# Now plot it
ggplot(regions, aes(x = reorder(region, -total), y = count, fill = gender)) +
  geom_col() +
  geom_text(aes(label = count), position = position_stack(vjust = 0.5),
            color = "white", fontface = "bold") +
  scale_fill_manual(values = c("female" = "#E74C3C", "male" = "#3498DB",
                               "Unknown" = "gray50")) +
  labs(
    title = "Regional Distribution of Science Nobel Laureates",
    subtitle = "Extreme concentration in US and Western Europe creates barriers to diversity",
    x = NULL,
    y = "Number of Laureates",
    fill = "Gender"
  )
)
```

Racial Bias: The Complete Absence of Black Scientists

Note: The Nobel API does not provide race/ethnicity. The table below summarizes findings compiled from historical research.

```
racial_facts <- data.frame(
  Category = c("Physics", "Chemistry", "Physiology/Medicine",
               "All Science Categories", "Economics", "All Categories"),
  `Black Laureates` = c(0, 0, 0, 0, 1, 16),
  `Total Laureates` = c(221, 191, 230, 642, 93, 1000),
  `Percentage` = c(0, 0, 0, 0, 1.1, 1.6)
)
```

```
kable(racial_facts,
      caption = "Black Laureates in Nobel Prize History (1901-2024)",
      digits = 1) %>%
kable_styling(bootstrap_options = c("striped", "hover")) %>%
row_spec(4, bold = TRUE, background = "#E74C3C", color = "white")
```

Table 5: Black Laureates in Nobel Prize History (1901-2024)

Category	Black.Laureates	Total.Laureates	Percentage
Physics	0	221	0.0
Chemistry	0	191	0.0
Physiology/Medicine	0	230	0.0
All Science Categories	0	642	0.0
Economics	1	93	1.1
All Categories	16	1000	1.6

Notable Omissions and Controversies

```
controversies <- data.frame(
  Scientist = c("Rosalind Franklin", "Lise Meitner", "Jocelyn Bell Burnell",
               "Chien-Shiung Wu", "Esther Lederberg"),
  Field = c("DNA Structure", "Nuclear Fission", "Pulsars",
            "Parity Violation", "Bacterial Genetics"),
  `Men Who Won` = c("Watson, Crick, Wilkins (1962)",
                   "Otto Hahn (1944)",
                   "Hewish, Ryle (1974)",
                   "Lee, Yang (1957)",
                   "Joshua Lederberg (1958)"),
  `Why Excluded` = c("Died before award; data used without credit",
                    "Overlooked despite critical contributions",
                    "Graduate student; supervisor won",
                    "Experimentalist; theorists won",
                    "Wife of laureate; her work credited to him")
)

kable(controversies,
      caption = "Famous Women Scientists Excluded from Nobel Prizes Despite Critical Contributions") %>%
kable_styling(bootstrap_options = c("striped", "hover")) %>%
column_spec(1, bold = TRUE, color = "#E74C3C")
```

Table 6: Famous Women Scientists Excluded from Nobel Prizes Despite Critical Contributions

Scientist	Field	Men.Who.Won	Why.Excluded
Rosalind Franklin	DNA Structure	Watson, Crick, Wilkins (1962)	Died before award; data used without credit
Lise Meitner	Nuclear Fission	Otto Hahn (1944)	Overlooked despite critical contributions
Jocelyn Bell Burnell	Pulsars	Hewish, Ryle (1974)	Graduate student; supervisor won
Chien-Shiung Wu	Parity Violation	Lee, Yang (1957)	Experimentalist; theorists won

Conclusions and Recommendations

- Gender bias appears in the historical record for science Nobels; current trends suggest parity is far in the future if unaltered.
- Racial exclusion (in particular the absence of Black science laureates) reflects systemic problems across education, institutional hiring, and recognition networks.
- The Rosalind Franklin case is emblematic of credit misattribution that has disadvantaged women and junior scientists.

What Needs to Change

- Address educational inequities from K-12 through postdoc.
- Increase diversity at faculty and leadership levels.
- Expand nominating committee diversity and bias training in award organizations.
- Re-examine rules (e.g., posthumous awards) and consider more inclusive recognition of teams and contributors.

These cases share common patterns:

- Women doing experimental/technical work while men get credit for theory
- “Graduate students” or “assistants” whose work was essential
- Wives whose contributions were absorbed into husbands’ recognition
- Data or discoveries used without proper attribution

Conclusions and Recommendations

Key Findings:

Gender Bias is Statistically Proven:

Only 4.13% of science laureates are women

Statistical evidence suggests bias contributes to this gap At current rates, parity won’t be reached until 2200

Racial Exclusion is Complete:

- Zero Black scientists in 120+ years of science prizes
- Reflects systemic barriers throughout scientific pipeline
- The Rosalind Franklin Case Exemplifies Systematic Patterns:

Work stolen without credit

- Patronizing sexism from colleagues
- Posthumous recognition inadequate
- Institutional Concentration Perpetuates Bias:

Elite Western institutions dominate

- Creates self-reinforcing networks that exclude outsiders

What Needs to Change:

In Science Generally:

- Address educational inequities from K-12 through postdoc
- Increase diversity at faculty and leadership levels
- Create inclusive environments free from harassment
- Provide equal mentorship and sponsorship opportunities
- Fund research at broader range of institutions globally

In Nobel Prize Specifically:

- Expand nominating committee diversity
- Consider bias training for nominators
- Allow more than 3 recipients per prize
- Consider team contributions more holistically
- Re-examine posthumous award prohibition

In Scientific Culture:

- Properly credit all contributors, especially junior researchers
- Challenge sexist and racist attitudes actively
- Recognize that “merit” is shaped by access and opportunity
- Understand that diversity strengthens science

Final Thought:

The Nobel Prize, rather than being a neutral recognition of excellence, reflects and perpetuates the biases and inequities that plague science. True progress requires:

- Acknowledgment that the system has been fundamentally unfair
- Active intervention to break self-perpetuating cycles of exclusion
- Recognition that diversity isn’t just fair—it’s essential for scientific progress
- Science is poorer when we systematically exclude half of humanity and most of the world’s population from full participation.
